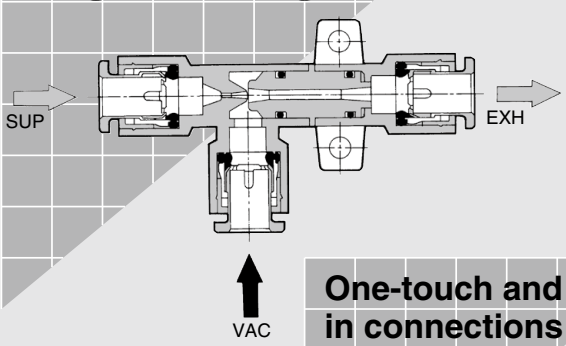
Nozzle diameter: ø0.5, ø0.7, ø1.0, ø1.3, ø1.5, ø1.8, ø2.0
Type S: Standard type
L: Large flow type

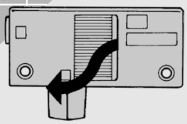
Compact and lightweight

The nozzle and the body, which have been made into a composite resin construction, are compact and lightweight.
Nozzle diameter ø0.5···28 g



Box type (Built-in silencer) Body ported

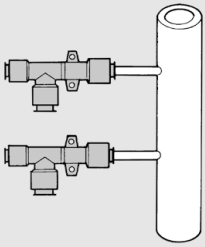
Two types are available in the series: the box type with a silencer exhaust, and the body ported type, with an individual exhaust.



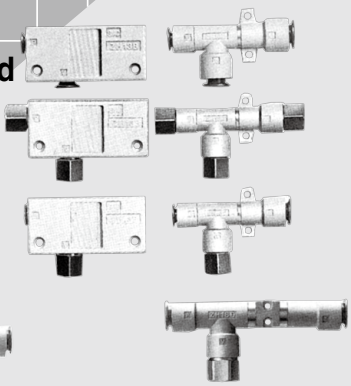
<Silencer exhaust>

One-touch and screw-in connections can be combined.

To suit the operating conditions, port connections can be combined with a choice of one-touch and screw-in connections.



<Centralized exhaust>



Body can be mounted and secured.

The body ported type is also provided with mounting holes for securing the body.

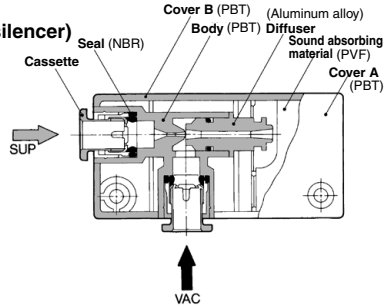
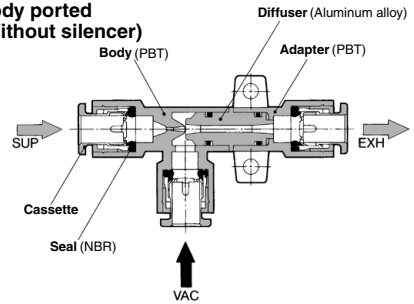
Box type (Built-in silencer)



Body ported (Without silencer)



⚠ Precautions

Be sure to read before handling.
Refer to front matter 35 for Safety Instructions and pages 899 to 901 for Vacuum Equipment Precautions.

⚠Caution

Mounting

Make sure that an excessive amount of load or moment is not applied to the ejector body due to pipe connections or installation.

Exhaust piping

On the ZH□□B□ models, keep exhaust ports open on at least one side. Make sure that the back pressure of the exhaust pipe on the ZH□□D□ models is 0.005 MPa or less. (Reference: Using tubing with an applicable diameter, its length must be 0.5 m or less.)
(Port indication: P: supply port; V: vacuum port; E: exhaust port.)

Selection and sizing

Refer to the vacuum equipment model selection on pages 877 to 898.

Exhaust Characteristics/Flow Characteristics

The flow characteristics correspond to a supply pressure of 0.45 MPa.

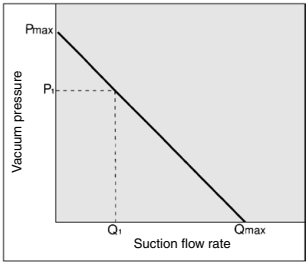
How to Read Flow Characteristics Graph



Flow characteristics are expressed in ejector vacuum pressure and suction flow. If suction flow rate changes, a change in vacuum pressure will also be expressed. Normally this relationship is expressed in ejector standard use.

In graph, Pmax is max. vacuum pressure and Qmax is max. suction flow. The valves are specified according to catalog use.

Changes in vacuum pressure are expressed in the order below.

1. When ejector suction vport is covered and made airtight, suction flow becomes 0 and vacuum pressure is at maximum value (Pmax).
2. When suction port is opened gradually, air can flow through, (air leakage), suction flow increases, but vacuum pressure decreases. (condition P1 and Q1)
3. When suction port is opened further, suction flow moves to maximum value (Qmax), but vacuum pressure is near 0. (atmospheric pressure).

When vacuum port (vacuum piping) has no leakage, vacuum pressure becomes maximum, and vacuum pressure decreases as leakage increases. When leakage value is the same as max. suction flow, vacuum pressure is near 0.

When ventirative or leaky work must be adsorbed, please note that vacuum pressure will not be high.

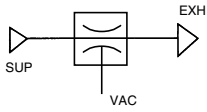
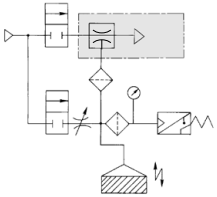
Example of Application Circuit

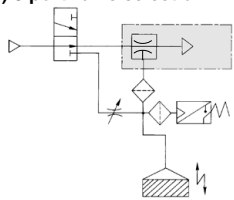
Basic Type



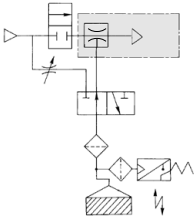
(a) Full system



(b) 3 port valve selection



(c) Switching on the vacuum side



Diagrams (a) to (c) show the combination with peripherals.

⚠Caution

Handling of application circuits

1. Countermeasures for power outages
Select a supply valve for the ejector that is normally open or one that is equipped with a self-holding function.

2. Using a small-diameter picking nozzle
For picking electronic parts or small precision parts, if the picking nozzle is approximately ø1 mm in diameter, the vacuum remains high by being restricted by the nozzle. As a result, it will not be possible to verify it with the vacuum switch. In such a case, it is necessary to use an ejector that is suited to the nozzle and to select a vacuum switch with a favorable hysteresis and precision.

3. Considerable leakage from the suction surface
If a workpiece is made of porous material or if there is air leakage from the area between the pad and the workpiece, use a nozzle with a large diameter and a large suction flow volume.
If the amount of leakage is known based on the effective sectional area of the side with the leakage, the vacuum pressure can be estimated in accordance with the ejector's flow volume characteristics.

4. Suction filter
To protect the ejectors and valves from dust, the use of a suction filter (Series ZFA, ZFB, ZFC) is recommended.

5. Use of a vacuum switch
It is recommended that verification be made with a vacuum switch as much as possible.

6. Vacuum release valve
To serve as a vacuum release valve, use a 2 port or 3 port valve that can be used under vacuum condition. For 3 port valves, the exhaust port should be plugged. In addition, add a needle valve that can regulate the flow volume of the vacuum releasing air. Use the atmospheric pressure or a positive pressure for the vacuum releasing pressure.

7. Common exhaust
For common exhaust as shown below, use an exhaust pipe big enough to prevent exhaust resistance.

Exhaust pipe with enough capability
